

# Nitrogen in Upland Cropping Systems

Soil Fertility Workshop

Louisiana Agricultural Technology & Management Conference

February 12, 2014

Paragon Casino Resort, Marksville, LA

**Brenda S. Tubaña**

School of Plant, Environmental, and Soil Sciences

LSU AgCenter

# Role of Nitrogen in Plant

- ◆ **Photosynthesis**

- ◆ Nitrogen is an integral component of chlorophyll

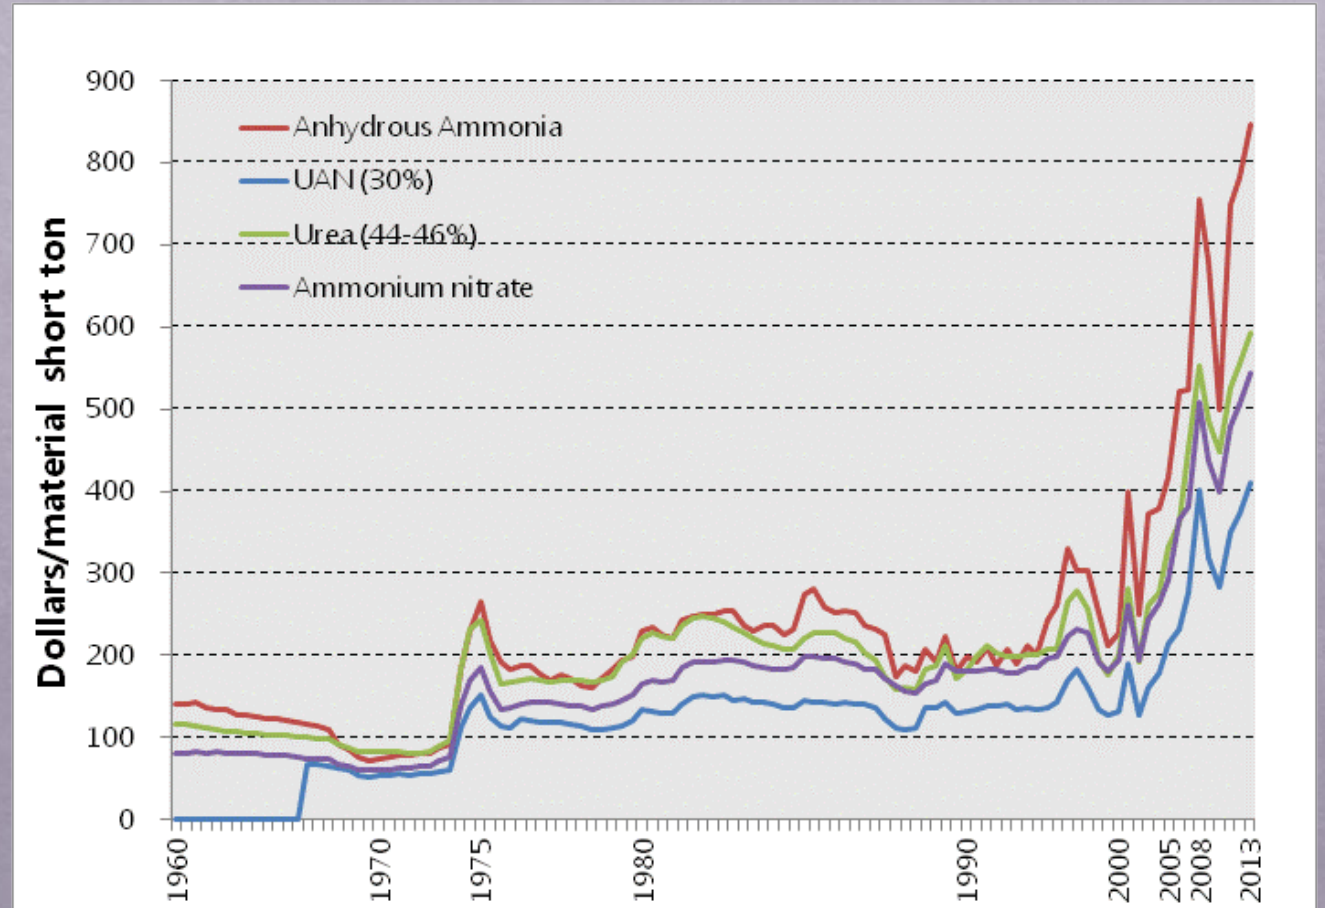

- ◆ **Metabolism and growth**

- ◆ At least one nitrogen in every amino acid; amino acids polymerize to form proteins and enzymes

# Nitrogen in Crop Production

- ◆ The most limiting nutrient
- ◆ Most expensive nutrient input
  - ◆ Apply in the largest amount
  - ◆ Increasing cost in the market

# Nitrogen - Chemically Complex, Dynamic

Oxidation State	Species	Name
-3	$\text{NH}_3, \text{NH}_4^+$	Ammonia, ammonium
-2	$\text{N}_2\text{H}_4$	Hydrazine
-1	$\text{NH}_2\text{OH}$	Hydroxylamine
0	$\text{N}_2$	Nitrogen gas
+1	$\text{N}_2\text{O}$	Nitrous oxide (laughing gas)
+2	$\text{NO}$	Nitric oxide
+3	$\text{HNO}_2, \text{NO}_2^-$	Nitrous acid, nitrite ion
+4	$\text{NO}_2$	Nitrogen dioxide
+5	$\text{HNO}_3, \text{NO}_3^-$	Nitric acid, nitrate ion

# Nitrogen Cycle – A Gaseous Cycle

- ◇ Gains
- ◇ Losses
- ◇ Sink

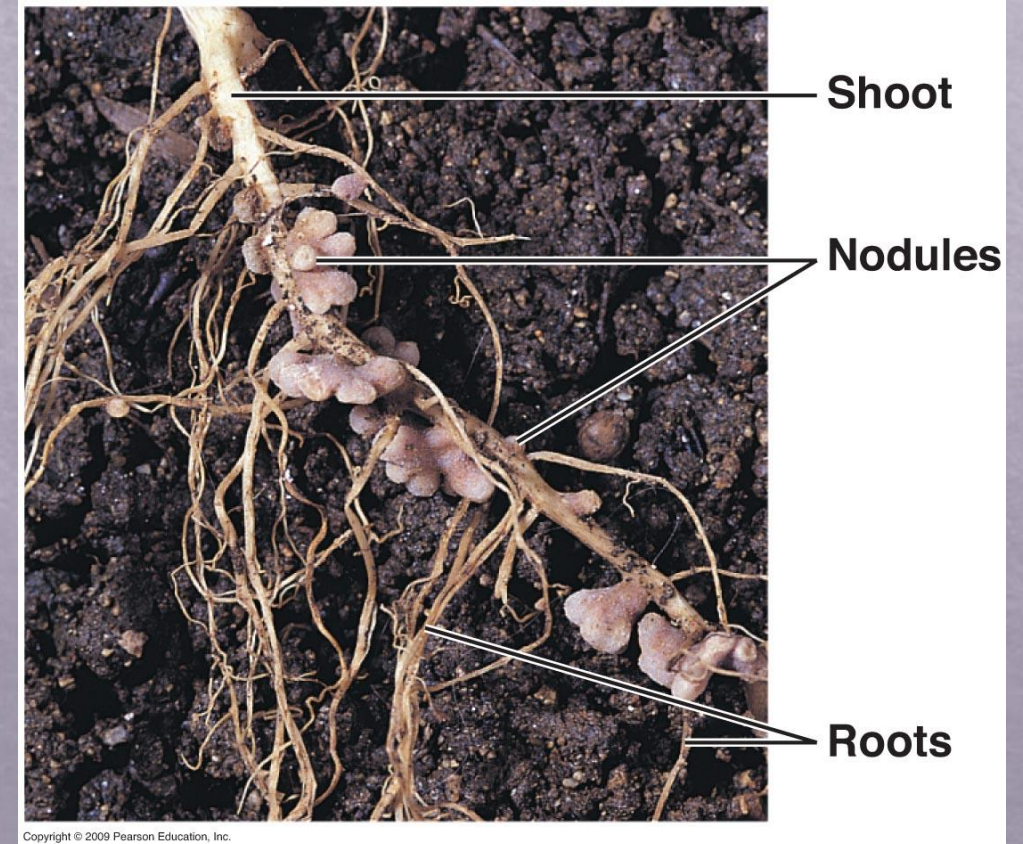

# SOURCES OF NITROGEN TO THE SOIL

- ◇ Biological N fixation
  - ◇ Deposition (rainfall, dust, alluvium)
  - ◇ Decomposition of organic matter
  - ◇ Fertilization
  - ◇ Organic amendments (manure, plant residue etc.)
- Natural Ecosystem**
- Agricultural Ecosystem**
- 
- The diagram illustrates the sources of nitrogen to the soil, categorized into two ecosystem types. A black bracket on the right groups the first three items (Biological N fixation, Deposition, and Decomposition) under the label 'Natural Ecosystem'. A red bracket on the right groups the last three items (Fertilization, Organic amendments, and an unlabeled item) under the label 'Agricultural Ecosystem'. The items 'Fertilization' and 'Organic amendments (manure, plant residue etc.)' are highlighted in red text.

# Biological Nitrogen Fixation

- ◇ Symbiotic
  - ◇ 357 lbs N/ac/year
  - ◇ e.g. Rhizobium and soybean
- ◇ Association
  - ◇ 178 lbs N/ac/year
- ◇ Free living
  - ◇ 70 lbs N/ac/year

# Deposition

## ◇ Rainfall

Atmosphere acts as a reservoir for nitrogen.

Atmospheric N – lightning  
Nitrous oxide – acid rain

## ◇ Dust

## ◇ Alluvium

# Organic Matter Decomposition

**Mineralization  
(inorganic form)**

$\text{NH}_4^+$   
 $\text{NO}_3^-$

**Immobilization  
(organic form)**

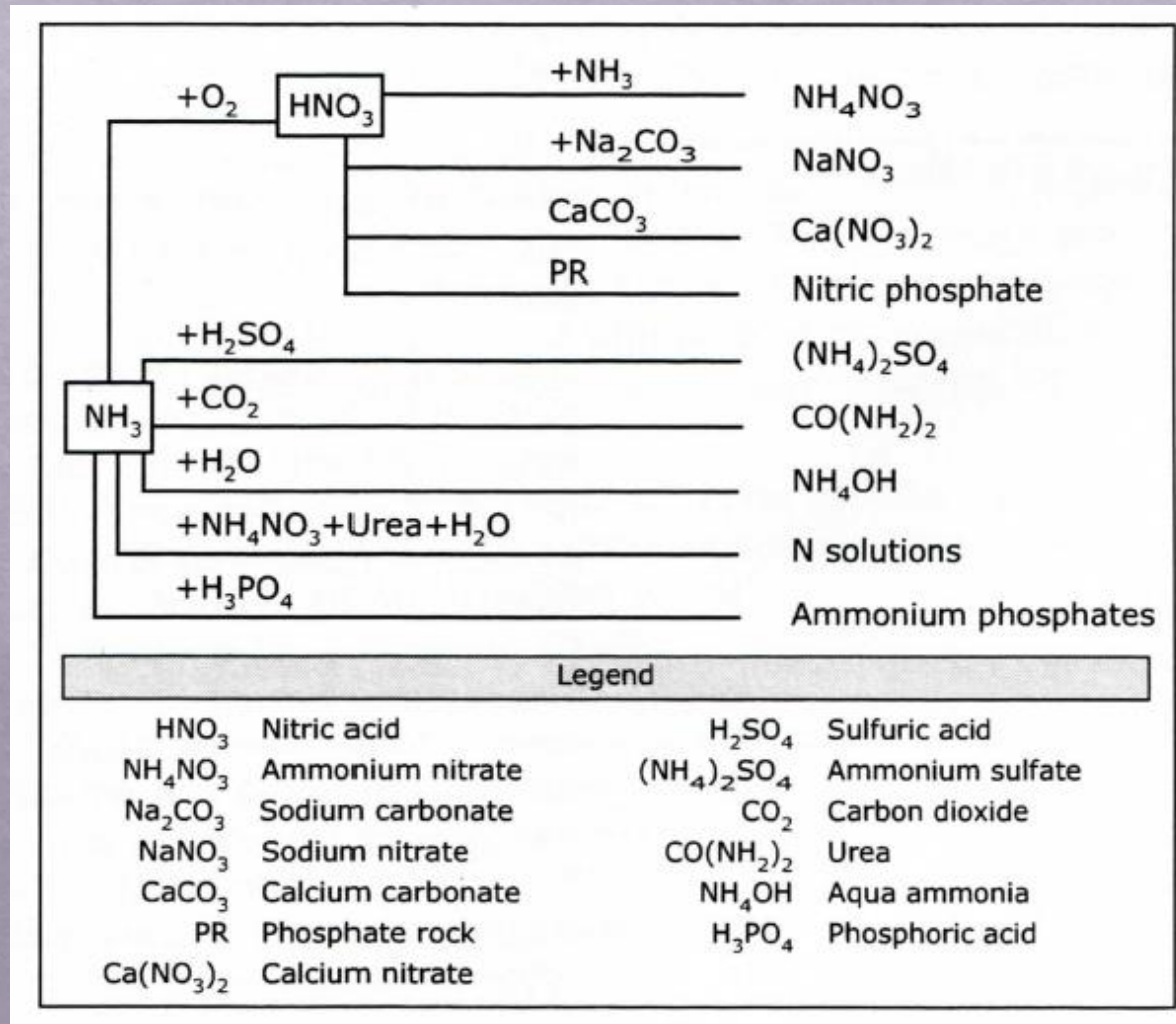

Amino acids, protein – crop stubble, soil organic matter, microbial biomass etc.

**TEMPERATURE**  
**MOISTURE**  
**ENERGY SOURCE**  
**SOIL pH**  
**AVAILABLE NUTRIENTS**  
**C:N RATIO**  
**QUALITY OF MATERIAL**

# Trends of Mineral Nitrogen Accumulation (by season)

- ◇ **Winter:** lowest due to low temperature
- ◇ **Spring:** usually highest
- ◇ **Summer:** declines due to plant uptake
- ◇ **Fall:** can increase due to residue decomposition

# Nitrogen Fertilization

# Organic Amendments

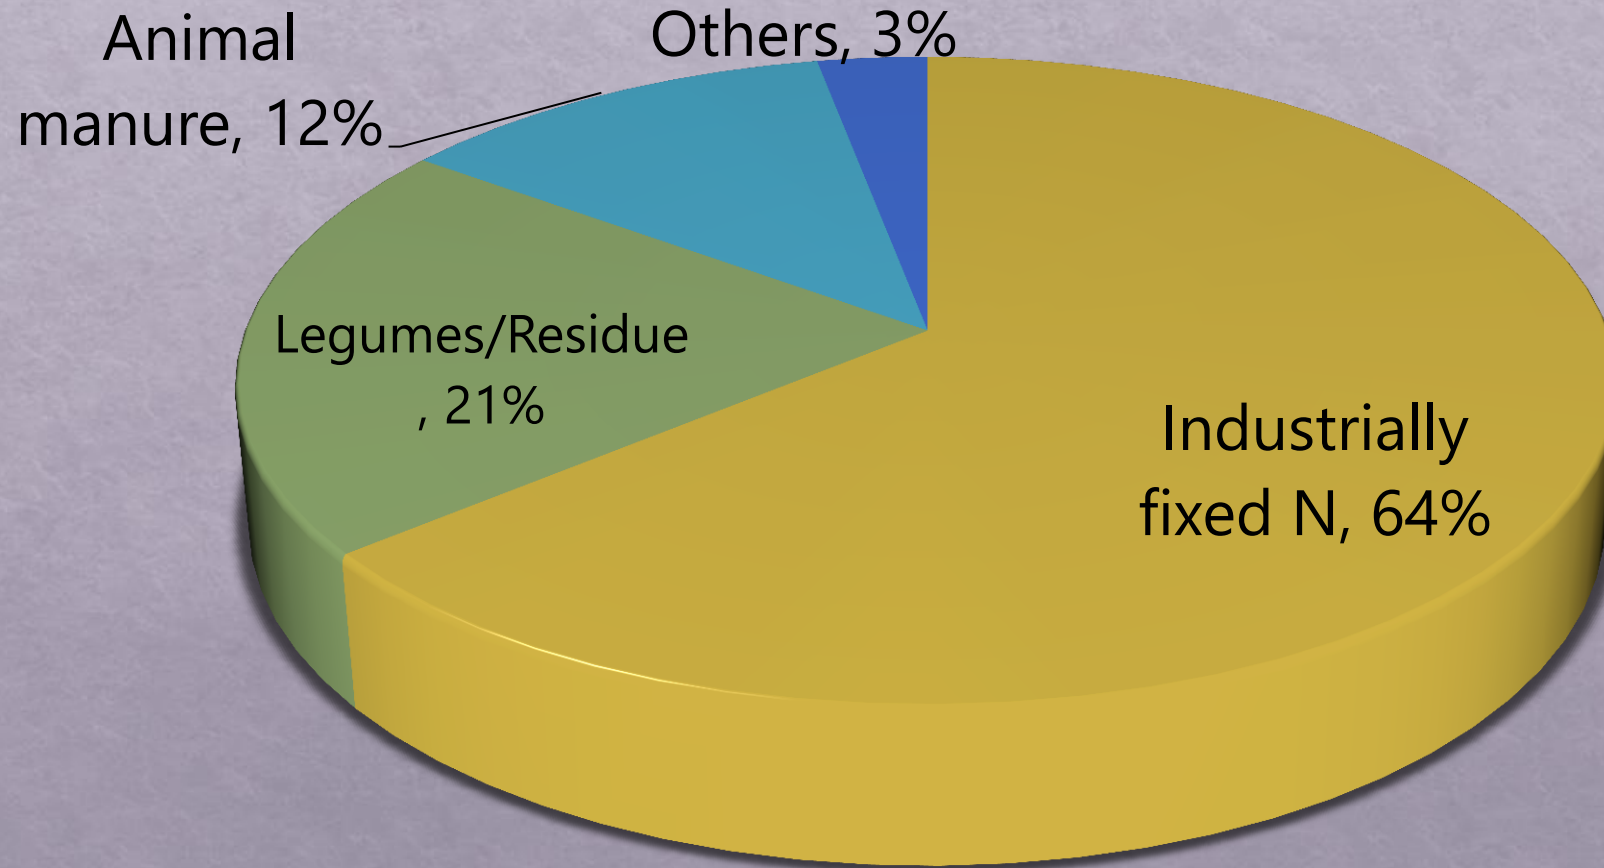

Animal manure application

Crop residue incorporation

# SOURCES OF N IN US CROP PRODUCTION

# Nitrogen Loss Pathways

- ◇ Crop removal
  - ◇ Nitrate leaching
  - ◇ Soil erosion and runoff
  - ◇ Denitrification
  - ◇ Volatilization
  - ◇ Plant N loss - volatilization
- } Gaseous form

# Nitrogen Loss Pathways

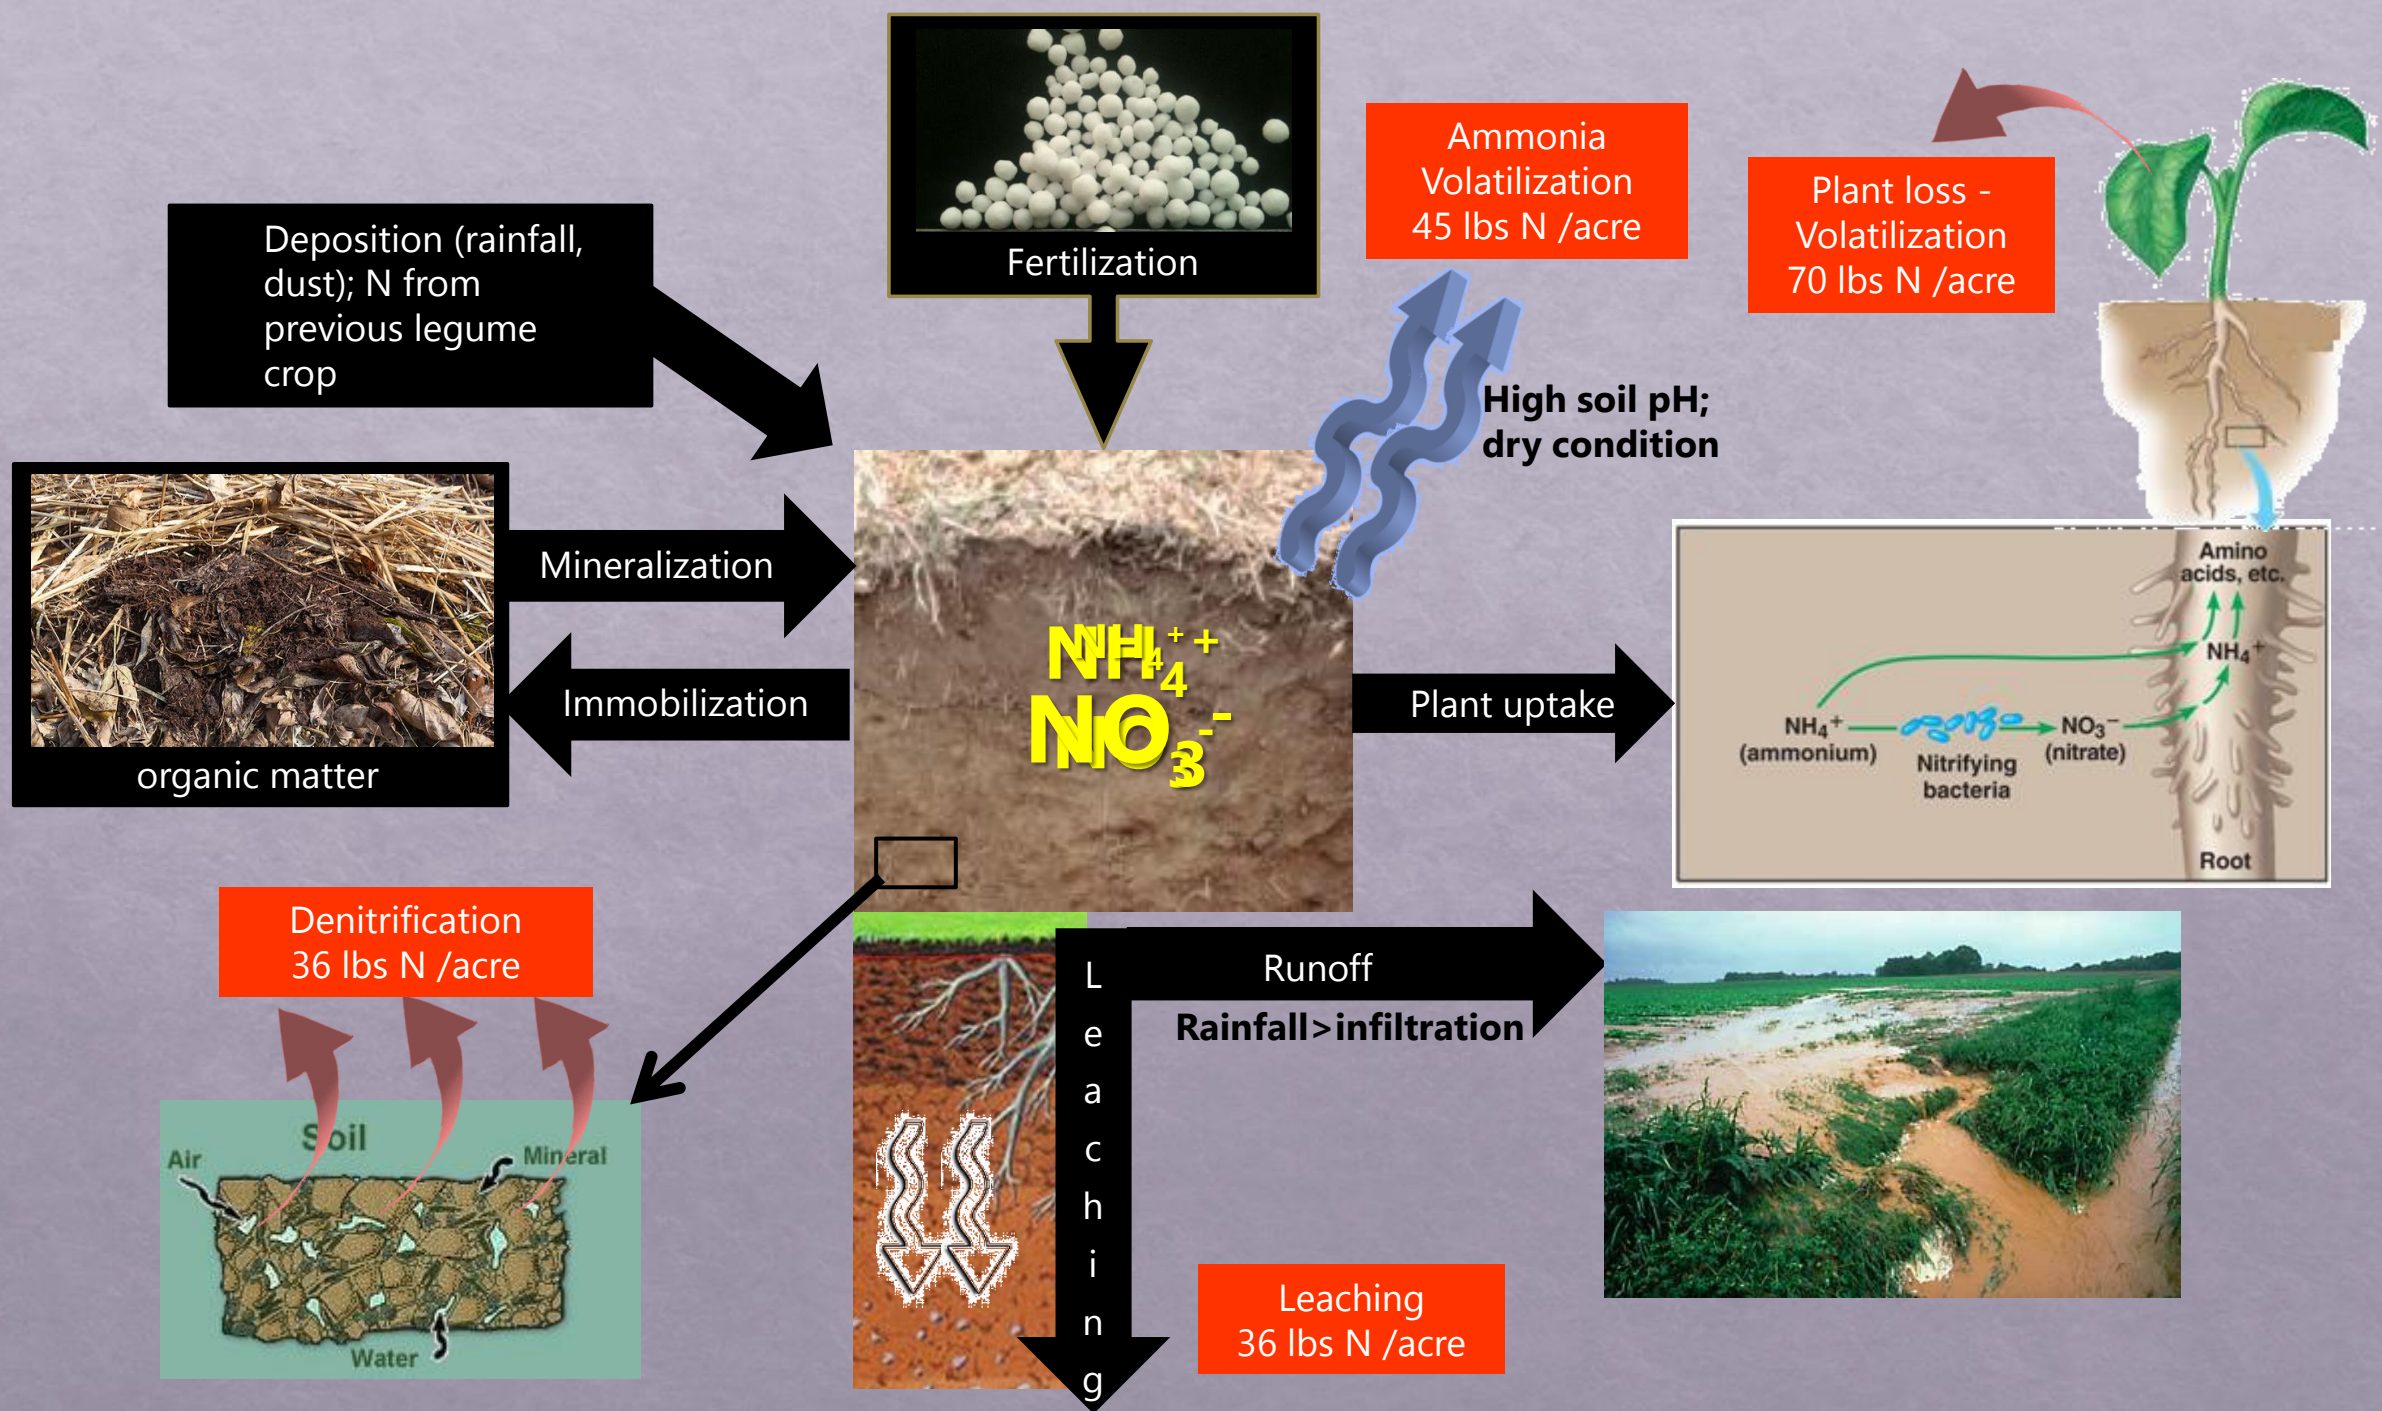

# Sources of Nitrogen Upland Cropping System

- ◇ Urea
- ◇ Urea ammonium nitrate
- ◇ Anhydrous ammonia

**Nitrate** is the major form of plant available N in most agricultural soil ( exception - flooded cropping system)

**There is a need to “manage” nitrogen  
fertilizer!**
